ABSTRACT

The method for controlling a computer that notifies an operating system of a request
event corresponding to a device event from hardware. A device event may be
generated, for example by a user operating a keyboard or mouse connected to the
computer. That is, the device event occurs when a certain event is provided to the
hardware of the computer. A request event causes a process corresponding to the
device event to be performed under the control of an operating system. Then a
response event from the operating system caused by the notification of the request
event is accepted and a process event corresponding to the accepted response
event is output to the hardware.
